Palavi

### The Objective

Our understaing of requirements are:

To create an automated check processing which helps to

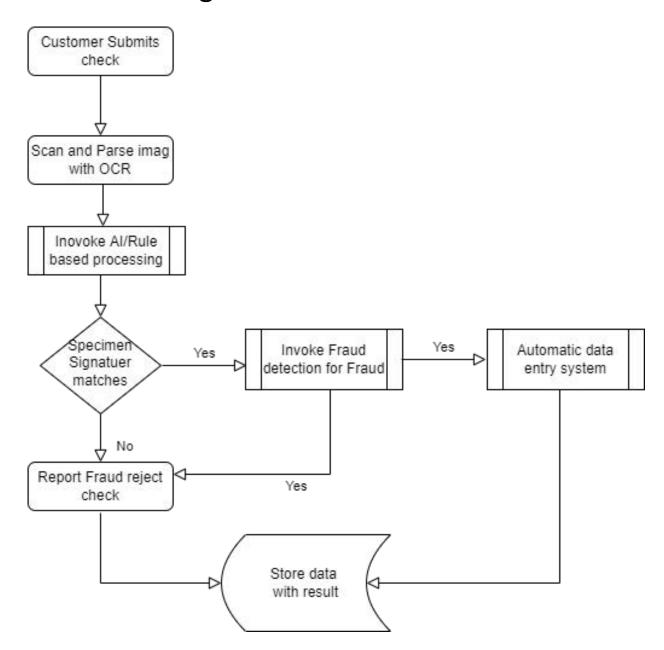

- 1. Verify signature
- 2. Using optical character recognization, converts amount, receiver and automates data entry in journal
- 3. Using Machine learning and artifical intelligence, OCR automate clearing process
- 4. Automatic Data Entry
- 5. Fraud detection to identify fradulent cheques

#### **Process Flow**

Process Flow diagram depicted in right side takes care of below process flow

- 1) Customer submits check
- 2) For offline check, scanner scans check and uploads check image to Azure blob
- 3) Azure function triggers once new image is uploaded to Azure Blob
- 4) Azure function calls OCR along with form recongonizer extracts signature, date, Pay or Bearer name, Account number, IFSC code, Amount
- 5) Extracted data is stored in Process folder a temporary blob folder or a storage document db
- 6) Same Azure function after getting signature compares with speciment signature of customer and gives score to verify signature
- This result will be send to Fraud detection Azure function which analyse based on historic data for fraud
- 8) Fraud detection alogirthm will be both rule based such as blocked account, money laundering, hawala fraud as well as
- 9) Al based which will be bogus check
- 10) Once signature verification and fraud detection checks are passed, processed data will be stored in Staging Datastore for further processing along with verification results

## **Process Flow diagram**

## The solution and archeiture

#### **Automated Check Processing Flow and Archieture**
